

Finalist for Technical Innovation of the Year - Products

DELIVERING A higher standard of fire protection

SPP Pumps was proud to be short-listed in the category of Technical Innovation of the Year - Products at the PIA held in Coventry on 23rd March 2011. There were eight awards of which SPP Pumps was nominated for two including Environmental Contribution of the Year for SPP's Energy Division.

FireEye was designed especially with the unique requirements of the fire pump industry in mind and its features have already helped to improve maintenance procedures on many sites.

Visibility of jockey pump activity via the FireEye website and the ability to receive a text and/or email if such activity exceeds a predetermined, customisable number of starts for example, has proven a very useful and popular addition to both new and older installations.

Features like these are helping FireEye users to build up a history of system activity. Equipped with a better understanding means they are also better placed to pre-empt and protect against potential equipment failure and very costly downtime.
